#### CIRCUIT DIAGRAM

www.expertguidance.co.uk

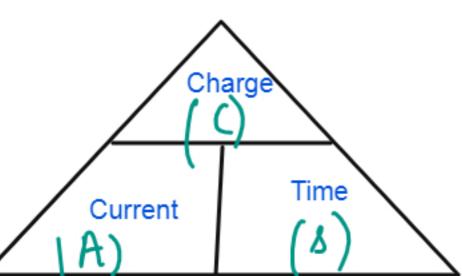

Draw a circuit diagram with a battery, bulb and a switch. How will you measure the current and potential Difference of the Circuit?

## CURRENT, POTENTIAL DIFFERENCE AND RESISTANCE

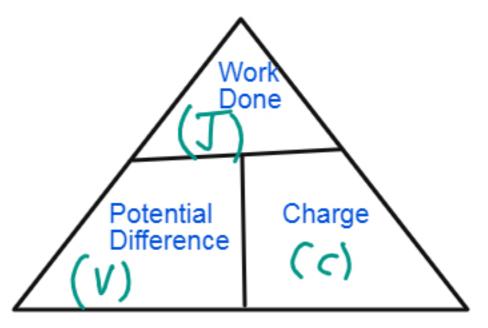

Current is the rate of flow of charge measured in Ampere.
One Ampere is the current flowing when one coulomb of charge flows through

one second.

Voltage Resistance is the obstruction to the flow of current measured in ohms .

Resistance Current (A)

Potential difference measured in Volts is the work done per unit charge.

$$IV = ITC_{-1}$$

One volts is the potential difference when 1 J of energy is transferred per coulomb of charge.

# **EXAMPLES**

www.expertguidance.co.uk

Q1 Calculate the current flowing when 4 C of charge flows for 2 minutes?

$$T = \frac{Q}{t} = \frac{4}{2\times600} = 0.033 A$$

Q2 Calculate the energy transferred when 2 V of potential difference creates a charge of 2 C

$$E = V \times Q = 2 \times 2 = 4 J$$
.

Q3 Calculate the resistance of the circuit when 4V of potential difference produces a current of 2 A.  $R = \frac{4}{5} = 2$ 

Q4 Calculate the charge when 5A of current flows for 5 minutes

Q5 Calculate the potential difference when 10 J of work done is done to move the charge of 5 C.

www.expertguidance.co.uk

COMDUCTOR

Linear Relationship

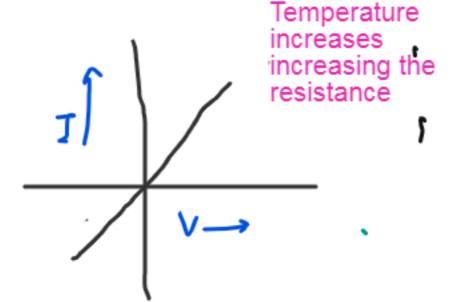

As the voltage increases, the current increases.

The resistance is constant.

#### **VOLTAGE-CURRENT GRAPH**

FILAMENT LAMP

As the voltage increases, the current increases at the start but after that bulb gets heated and increase in temperature increases resistance so the current do not increases and the graph curves.

Threshold voltage

Thigh resistance in reverse direction

Diode conduct electricity in one direction. In reverse direction, the resistance is too high so no current flows. When it reaches a threshold voltage, the current starts to increases then linearlt.

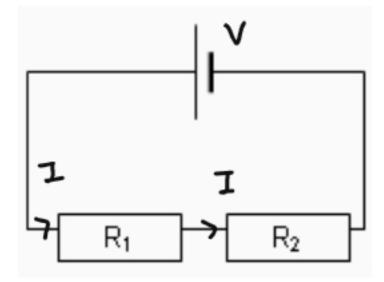

## SERIES AND PARALLEL CIRCUITS

## www.expertguidance.co.uk

#### SERIES CIRCUIT

Total Resistance is greater than individual = R1+ R2 = Revision

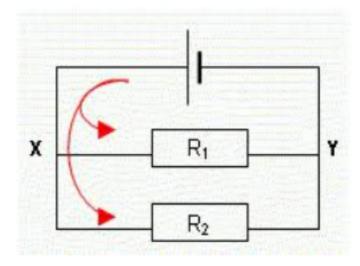

Current Across each component is the same =  $\frac{V(total)}{R(total)}$  =  $\frac{I}{R(total)}$ 

Voltage gets divided between each component

$$V_1 = IR$$
,  $V_2 = IR_2$ 

www.expertguidance.co.uk mahima.laroyia@expertguidance.co.uk +447448352272

#### PARALLEL CIRCUIT

Total resistance is less than individual =  $R_{total} = \frac{R_1 R_2}{R_1 + R_2}$ Voltage is same across each component = V

Current gets divdied between the components

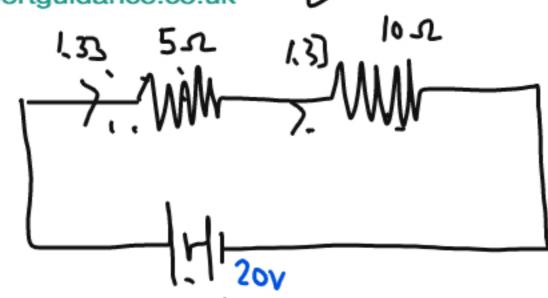

$$\frac{1}{4} = \frac{V}{R_1}$$
  $\frac{J_2 = V}{R_1}$ 

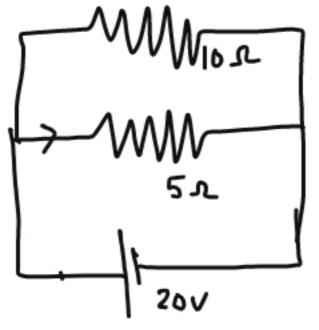

Current = 
$$\frac{20}{15}$$
 = L33A

Voltage across 5 ohms 
$$= 1.33 \times 5 = 1.33 \times 5$$

Voltage across 10 ohms = 
$$1.33 \times 10^{\circ}$$
 r  $13.3 \times 10^{\circ}$ 

Total Resistance = 
$$\frac{K_1R_2}{R_1+R_2} = \frac{50}{15} = 3.33$$

Total Current = 
$$\frac{V_{total}}{R_{total}} = \frac{20}{3.33} = 6A_{total}$$
Current across 5 ohms =  $\frac{20}{5}$ 
Current across 10 ohms

 $\frac{10}{10} = 2$ 

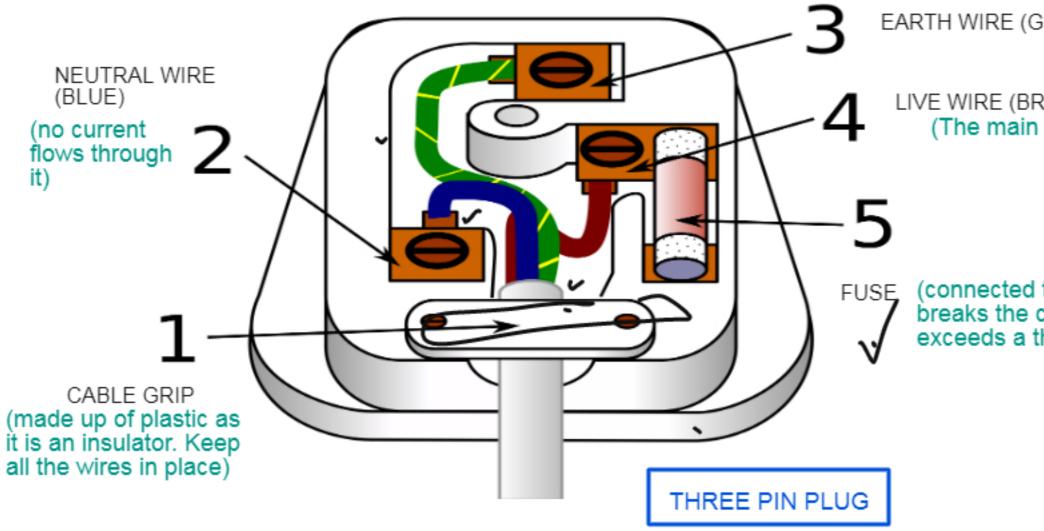

MAIN ELECTRCITIY

Outer casing is made up of plastic as it is an insulator and pins are made up of brass as it is a conductor and resistant to corossion

# **ELECTRIC POWER**

1 W is the power when 1 Joule of energy is transferred for one second.

Electrical Power = 
$$V \times T$$
  
(voltage)  $\times$  (current)  
 $P = T^2 \times R$  [ $V = J \times R$ ]  
 $P = V^2$ 

# **EXAMPLES**

Q1 Calculate the current product by 200 W bulb if it generate a voltage of

10 V

$$200 = I = 20.$$

Q2 Which is the best fuse for this appliance.

$$I = P = \frac{200}{10} = 20A$$

15,20, 23A or 25A

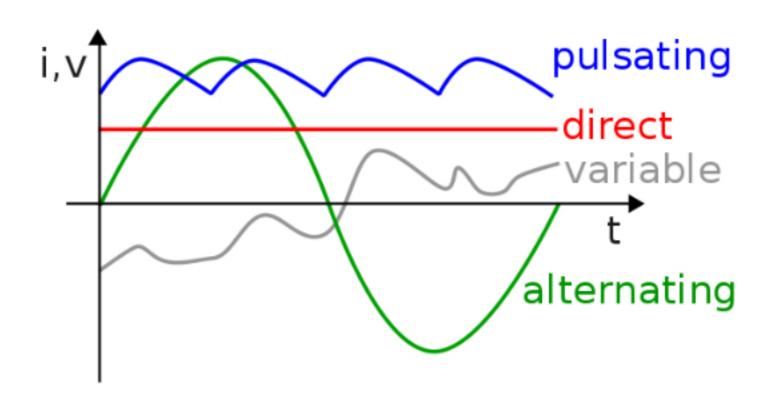

So the fuse of slightly greater than 20 A will be useful. So it has to be 23 A.

# DIRECT AND ALTERNATING CURRENT

www.expertguidance.co.uk

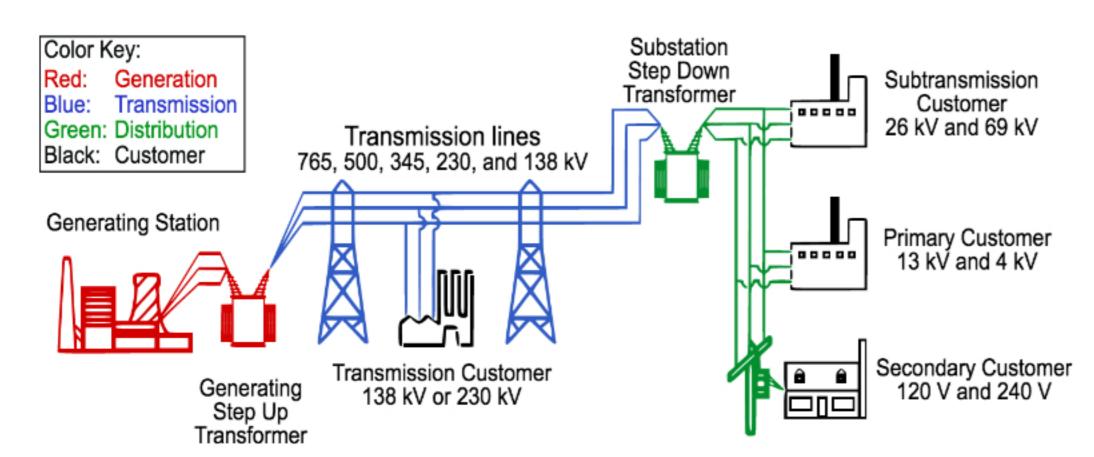

| DIRECT                               | ALTERNATING                     |
|--------------------------------------|---------------------------------|
| Current that flows in one direction. | Current that changes direction. |
| Current in cell and batteries.       | Current in the mains supply.    |

# **NATIONAL GRID**

Source: Wikimedia Commons

A network of cable and transformers that transmits electricity from a power station to homes and buildings.

Step up transformer is used to increase the voltage for transmission. As higher voltage will have less current and so less loss of energy due to heating effect of current.

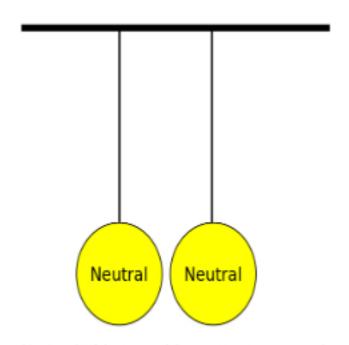

# STATIC ELECTRICITY

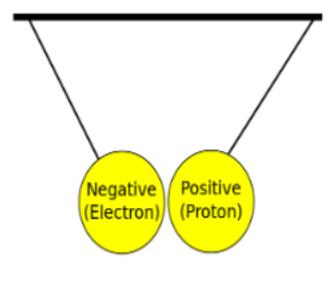

www.expertguidance.co.uk

LIKE CHARGES REPEL and UNLIKE CHARGES ATTRACT EACH OTHER

Neutral objects neither attract or repel.

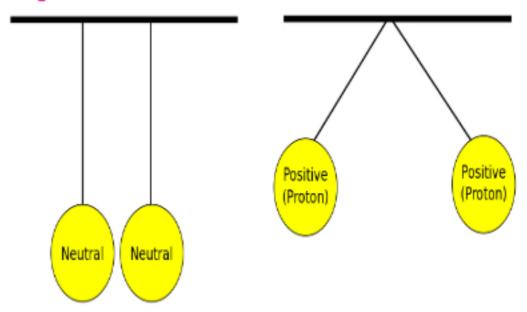

Oppositely charged objects attract.

Source: Wikimedia Commons

Electricity due to the charge produced by rubbing.

Atom is neutral. Due to rubbing there is a movement of electrons from one surface to another.

The surface that loose electrons become negatively charged and the surface that gains electron become positively charged.

Neutral objects neither attract or repel.

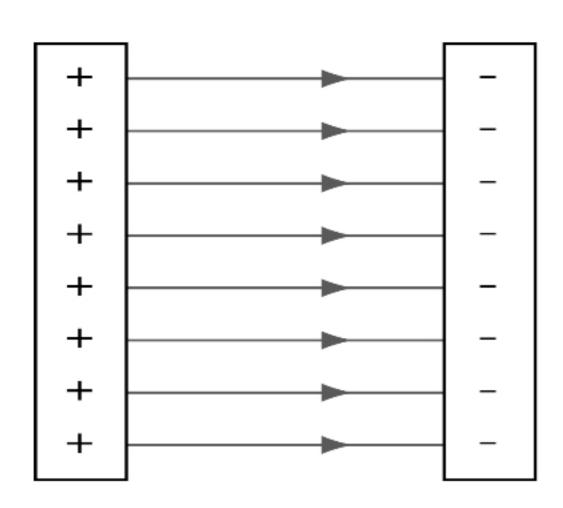

Objects with the same charge repel.

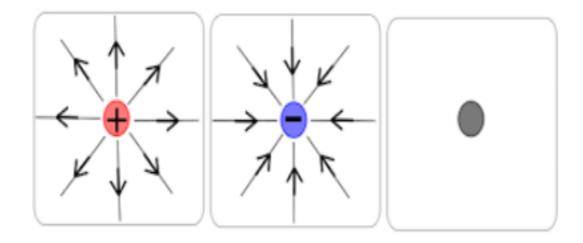

# **ELECTRIC FIELDS**

www.expertguidance.co.uk

Electric Field of line always travel from positive to negative.

It is the area around a charge object where force of electricity can be felt.
